1. Introduction

Lisbon is the capital district of Portugal, making it the most important financially and the most populous, creating a lot of business opportunities. Nevertheless, Lisbon is the area with the higher price per square meter in all of the country, creating the necessity of a good prior analysis to choose the best location to open a new venue.

1.1. Business Problem

Being expected a higher percentage of the population to have obesity, after the lockdown imposed by the current pandemic disease (covid-19), I believe that there will be a greater search for gyms as it happened after the first lockdown in the country.

Having this special occasion, it will be a great opportunity to open a new facility in this city, that fulfill the necessities of the population.

My objective with this project is to localize the best spot in Lisbon to open a new facility, that ideally will be located in an area with lower offer of this kind of facilities, an area that have a low ratio of gym per inhabitant and also an area that have a low rating for the current opportunities.

2. Data

The data used was obtained in two websites:

- The first file that I used was a CSV obtained in https://simplemaps.com/data/world-cities, with all the geographic and demographic data necessary about the cities in the Lisbon District, creating a database with the following columns:
 - 1)City Name
 - 2)City Latitude
 - 3)City Longitude
 - 4)City Population

Table 1 – Database of cities of the world (sample)

	city	city_ascii	lat	Ing	country	iso2	iso3	admin_name	capital	population	id
0	Tokyo	Tokyo	35.6897	139.6922	Japan	JP	JPN	Tōkyō	primary	37977000.0	1392685764
1	Jakarta	Jakarta	-6.2146	106.8451	Indonesia	ID	IDN	Jakarta	primary	34540000.0	1360771077
2	Delhi	Delhi	28.6600	77.2300	India	IN	IND	Delhi	admin	29617000.0	1356872604
3	Mumbai	Mumbai	18.9667	72.8333	India	IN	IND	Mahārāshtra	admin	23355000.0	1356226629
4	Manila	Manila	14.5958	120.9772	Philippines	PH	PHL	Manila	primary	23088000.0	1608618140

- To get the data about the gyms I used the Foursquare API, serching for gyms in a radius of 500m from the city coords and obtained a database with the following columns:
 - 1)Venue Name
 - 2)Venue Latitude
 - 3)Venue Longitude

Table 2 – Database of gyms in Lisbon District (sample)

	Neighborhood	Neighborhood Latitude	Neighborhood Longitude	Venue	Venue Latitude	Venue Longitude	Venue Category
0	Lisbon	38.7452	-9.1604	Malo Clinic	38.746271	-9.163602	Medical Center

3. Methodology

To start with the data of this project, it was necessary to clean the data from the CSV file, with the world cities information. The first steps of this cleaning were choosing only the cities of Portugal and then only the Lisbon district. These assured that I didn't have data of another Lisbon district in another country. Although the dataset was reduced substantially in the number of rows, I still had a lot of useless information in the 11 columns. So, I created the final dataset only selecting the columns with the name of the cities (city), latitude (lat), longitude (lng) and the number of residents (population).

These two cleaning steps transformed the original dataset with 26569 rows and 11 columns to a reduced dataset of 21 rows and 4 columns.

	city	city_ascii	lat	Ing	country	iso2	iso3	admin_n	ame	capital	populatio	n	id

Figure 1 – Representation of the cleaning phase for the cities' dataset

To better understand the data, I used the folium library to create a visualization map which enabled me to see the geographical distribution of the cities. It was easy to understand that some cities were very close to each other, so the presence of a gym in one of them could surpress the needs of the other (ex: Agualva and Cacém). On the other hand, there were cities too distant from each other, creating the necessity that both cities must have a gym (ex: Estoril and Azambuja). Having these information, I decided to create proximity clusters for the cities, creating 4 groups, using KMeans Cluster from sklearn.cluster library.

	Cluster Labels	city	lat	Ing	population
0	0	Lisbon	38.7452	-9.1604	506654
1	0	Amadora	38.7500	-9.2333	175136

Figure 2 – Creation of the final dataset for Lisbon district cities

Being satisfied with the dataset for the Lisbon district cities, I started the collection of data for the venues in those cities using the Foursquare API.

```
In [19]: Category='4bf58dd8d48988d175941735'
                             def getNearbyVenues(names, latitudes, longitudes, radius=500):
                                         venues_list=[]
                                        for name, lat, lng in zip(names, latitudes, longitudes):
    print(name)
                                                     # create the API request URL
                            url = 'https://api.foursquare.com/v2/venues/explore?categoryId=4bf58dd8d48988d175941735&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_id={}&client_i

 decision

Out[33]:

	lat	Ing	population	frequency
Cluster Labels				
0	232.6052	-55.1567	937611	11
1	117.0000	-26.9167	172091	0
2	349.1443	-83.9813	380751	13
3	117.3500	-27.5167	104146	0

Looking at these tables, it is easy to see that in the Lisbon district we have 12 cities that doesn't have any gym, 1 city with 1 gym, 4 cities with 2 gyms, 1 city with 3 gyms and 3 cities with 4 gyms.

With a broader perspective, looking for the clusters created, 2 of them (1 and 3) do not have any gym, the cluster 0 have 11 gyms which means 1 gym for 85237 habitants, and the cluster 2 have 13 gyms that represents 1 gym for 29289 habitants.

5. Discussion

During the cleaning phase of the data, I quickly realized a major limitation of Foursquare in Portugal, that is the unfamiliarity with this app causing deficits in the data. This could be observed with the absence of any data about Holmes Place gyms that is the biggest franchise of premium gyms in the country.

Assuming the data extracted from Foursquare as being accurate and updated, the results obtained show a vast opportunity for someone to open this kind of business in the Lisbon district, since the majority of the cities do not offer any facility of this kind and the ones that have, offer a really poor ratio of venues per habitant.

Having to take a final decision, I would see which cluster would have a higher ratio of habitant per gym to choose the area that would create the most opportunities for my business. Looking to the results the first logical conclusion is to choose the cluster 1. Analyzing these cluster and maintaining the same evaluation criteria, the city with the highest population is Vila France de Xira, and that looks like the best option.

Given these results, I don't believe that it is necessary a more profound study, where it would be compared the ratings of the gyms in each city.

6. Conclusion

Knowing the limitations explained previously, about the unfamiliarity with Forsquare App, my suggestion based on the available data, for this study, is that the best city to open a new gym is Vila Franca de Xira, being the most populous and inserted in a cluster without any gym.

Nevertheless, I strongly suggest a future study to construct a more complete database about the location of the existing gyms in Portugal, particularly in Lisbon, to give a more robust opinion about this matter.
